Preface

xiii

Part 1 Science

1. Introduction to renewable carbon—Concept and properties	3
1.1 Introduction	6
1.2 The renewable carbon concept in modern society	7
1.3 Introduction to carbonaceous raw materials for industrial purposes	8
1.4 Physicochemical properties of relevant carbonaceous materials	14
1.5 Relation between renewable carbon and green chemistry	22
1.6 Conclusions	24
References	24
2. Organic synthesis for carbon derivatives	27
2.1 Introduction to organic synthesis applied to renewable carbon products	27
2.2 Organic processes for the synthesis of renewable carbon products	32
2.3 Industrial carbon-based organic chemicals: A case study	36
2.4 Industrial carbon-based organic materials: A case study	37
2.5 Conclusions	39
References	40
3. Inorganic and thermochemical syntheses for carbon derivatives	41
3.1 Introduction to inorganic and thermochemical syntheses applied to renewable carbon products	41
3.2 Inorganic and thermal processes for the synthesis of renewable carbon products	43
3.3 Industrial carbon-based inorganic chemicals: A case study	49
3.4 Industrial carbon-based materials: A case study	51
3.5 Conclusions	52
References	52

4. Biochemical synthesis for carbon derivatives	55
4.1 Introduction to biochemical synthesis applied to renewable carbon products	55
4.2 Biochemical processes for the synthesis of renewable carbon products	57
4.3 Industrial carbon-based biochemical: A case study	65
4.4 Conclusions	68
References	68
5. Conclusions and remarks of the scientific aspects for renewable carbon	71
5.1 Remarks	71
5.2 Conclusions	73
References	74
Part 2 Technology	
6. Introduction to technological approaches for renewable carbon	77
6.1 Main industrial sources of renewable carbon	77
6.2 Main technologies for renewable carbon conversion and their challenges	80
6.3 Technology readiness level assessment	82
6.4 Advantages and disadvantages of renewable carbon feedstock	83
6.5 Conclusions	85
References	85
7. Carbon capture and use strategies for carbon dioxide	87
7.1 Introduction to carbon capture and use strategies	87
7.2 Adsorption technologies	90
7.3 Absorption technologies	90
7.4 Membrane separation technologies	92
7.5 Chemical capture technologies	92
7.6 Analytical technologies for CO ₂ monitoring	99
7.7 Case study: The TRL assessment for CCU technologies for energetic sources	101
7.8 Conclusions	103
References	103

8. Applied nanotechnology for carbon dioxide, biomass, and recycling materials	105
8.1 Introduction to nanoscience and nanotechnology	105
8.2 Nanotechnology applied to CO ₂ : A case study	109
8.3 Nanotechnology applied to biomass derivatives: A case study	111
8.4 Nanotechnology applied to recycling materials: A case study	113
8.5 Conclusions	114
References	114
9. Applied biotechnology for biomass	117
9.1 Introduction to industrial biotechnology	117
9.2 Biotechnology applied to agroindustrial waste: A case study	125
9.3 Conclusions	127
References	127
10. Applied thermochemistry for biomass and recycling materials	129
10.1 Introduction to industrial thermochemistry	129
10.2 Thermochemistry applied to agroindustrial biomass residues: A case study	137
10.3 Thermochemistry applied to recycling materials: A case study	141
10.4 Conclusions	144
References	144
11. Catalysis for carbon dioxide and biomass	145
11.1 Introduction to industrial catalysis	145
11.2 Homogeneous catalysis applied to agroindustrial biomass: A case study	152
11.3 Homogeneous catalysis applied to CO ₂ : A case study	154
11.4 Heterogeneous catalysis applied to agroindustrial biomass: A case study	154
11.5 Heterogeneous catalysis applied to CO ₂ : A case study	155
11.6 Conclusions	156
References	156
12. Remarks and conclusions of the technological aspects for renewable carbon	159
12.1 Remarks	159
12.2 Conclusions	162
References	163

Part 3 Sustainability

13. Introduction to the sustainability concept applied to renewable carbon	167
13.1 The sustainability concept and its components	167
13.2 Circular economy approach for renewable carbon	170
13.3 Green chemistry approach for renewable carbon usages	170
13.4 Anthropogenic and biogenic carbons and their influence on the climate change	172
13.5 The footprint carbon for products and processes	173
13.6 The carbon market	175
13.7 Conclusions	176
References	178
14. Metrics and measurements	179
14.1 The lifecycle assessment	179
14.2 Environmental impact calculation for products and processes	182
14.3 LCA for biofuels: A case study	186
14.4 Conclusions	189
References	189
15. Alternative sources to petrochemicals: New value chains	191
15.1 Introduction to the petrochemical value chains	191
15.2 Alternative feedstocks for chemicals and materials	194
15.3 Strategy to create sustainable value chains based on renewable carbon	198
15.4 Renewable building blocks: A case study	198
15.5 Conclusions	199
References	200
16. Strategies for industrial ecology	201
16.1 Introduction to industrial ecology	201
16.2 Ecofriendly approaches for renewable carbon	202
16.3 Industrial ecology in chemical industry: A case study	205
16.4 Conclusions	207
References	207

17. Remarks and conclusions of the sustainability aspects for renewable carbon	209
17.1 Remarks	209
17.2 Conclusions	211
References	212
Further reading	212
